

# Algorithm Avengers

To Buy or Not to Buy: Investigating Customer Patterns in the Online Shopping Experience

By Harry Kim, Matthew Ohanian, Bennett Cohen, Pieter van Tol

A decorative light blue triangle is located in the bottom right corner of the slide, pointing towards the top right.

# The Data

7-day web data from Fingerhut between 12/10/2022 ~ 12/17/2022

In that timespan ~

- 2,040,966 unique visits
- 577,004 registered users

# Peek into the data

Sunday - Tuesday

# Research Question

**What patterns exist among customers who add to their shopping cart and actually make a purchase versus customers who abandon cart?**

# How we tackled the data

Focused on extracting information from variables that fulfilled the following:

- Described the **customer** or the **features of their visits**
- **Scalable** to each customer visits

# Example of Data Extraction

**shopduration** = max(hit\_time\_gmt) - min(hit\_time\_gmt)

**OrderTRUE** = as.logical(any(ordernumber > 0))

**AddtoCart** = sum( str\_detect(clickaction, "Add to Cart") |  
str\_detect(eventlist, ",12,") )

# Target Variables

Add To Cart: Placing item in Cart and triggering Add To Cart Log

Abandoning Cart: Add to Cart True and no Order/Purchase

OrderTRUE: If the user had an order number

# Cleaning Data

## Limitations of Unregistered Users

Not Registered

Registered

## User Actions

-  Added to Cart
-  Not Added to Cart
-  Ordered from Cart

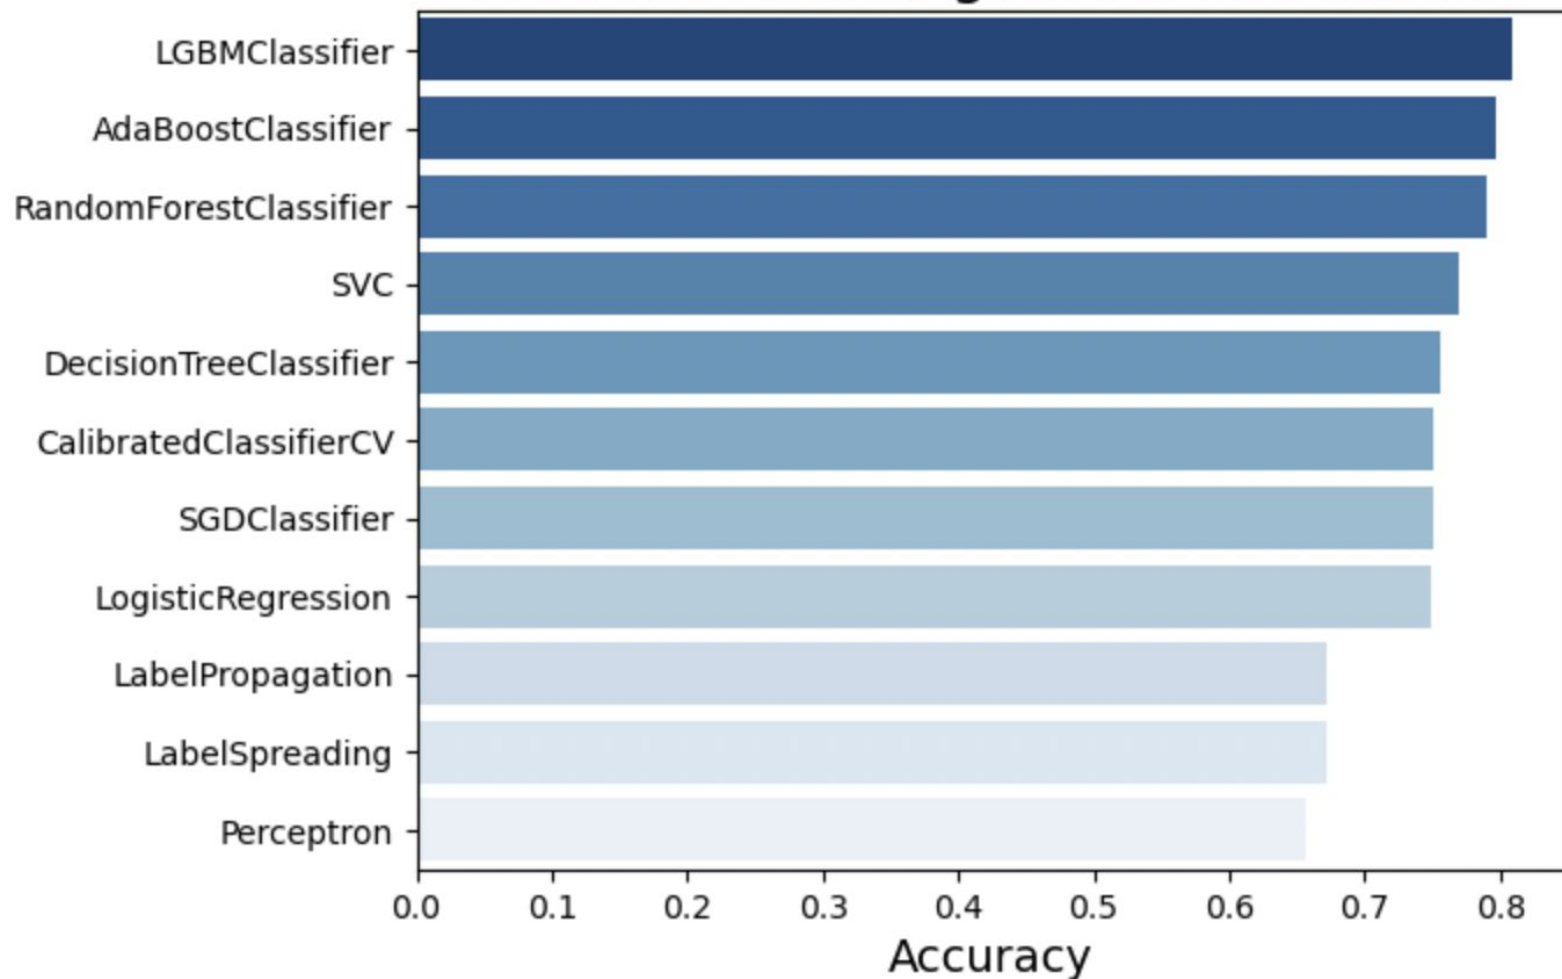

# Machine Learning

- Supervised Classification Model
- Target variable:
  - Abandoned cart
  - Purchased from cart

## Top Performing Models

- Light Gradient Boosting
- Random Forests
- Adaptive Boosting
- Support Vector Machines

# Machine Learning Model Accuracies

# Random Forests

Test Accuracy: 85.42

# Notable Variables

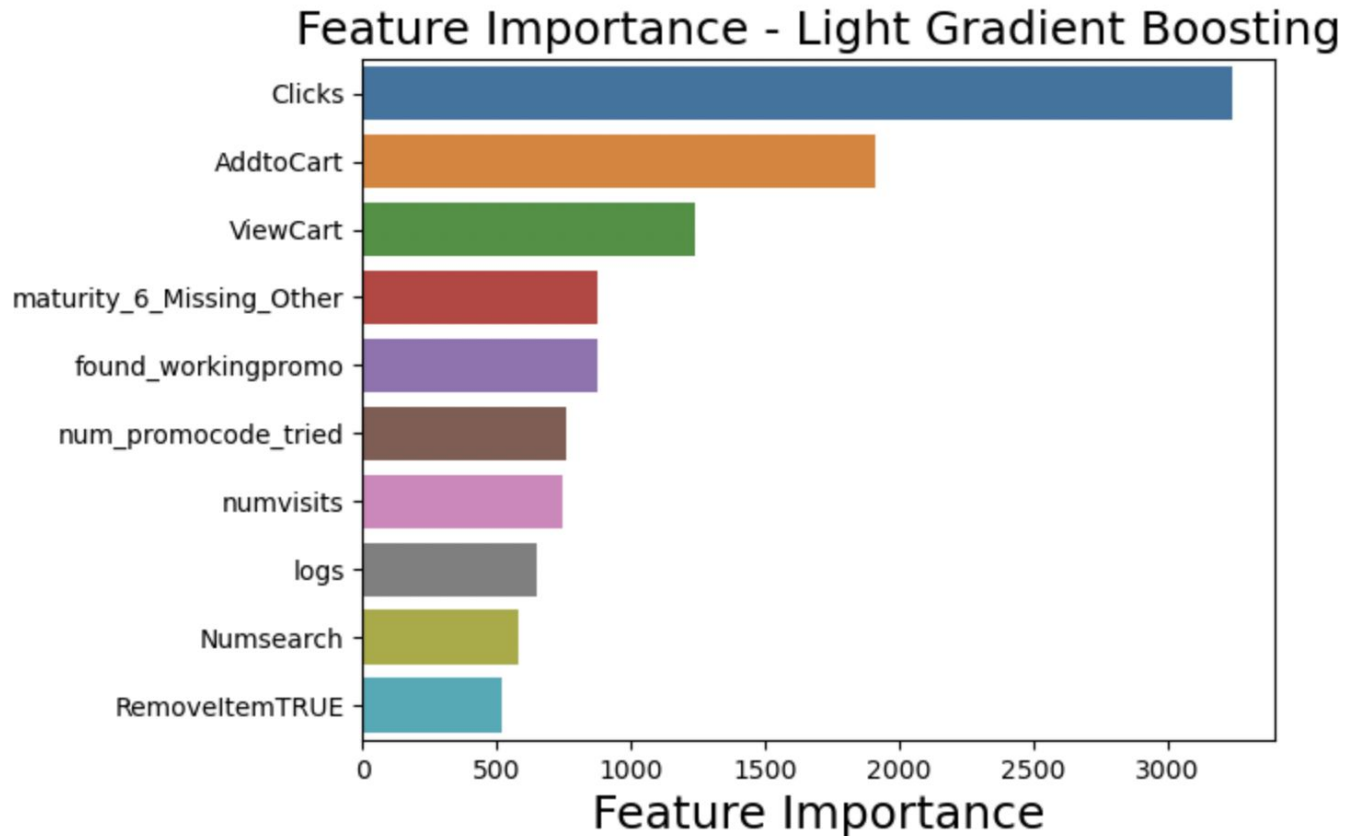

# Light Gradient Boosting

Test Accuracy: 85.70

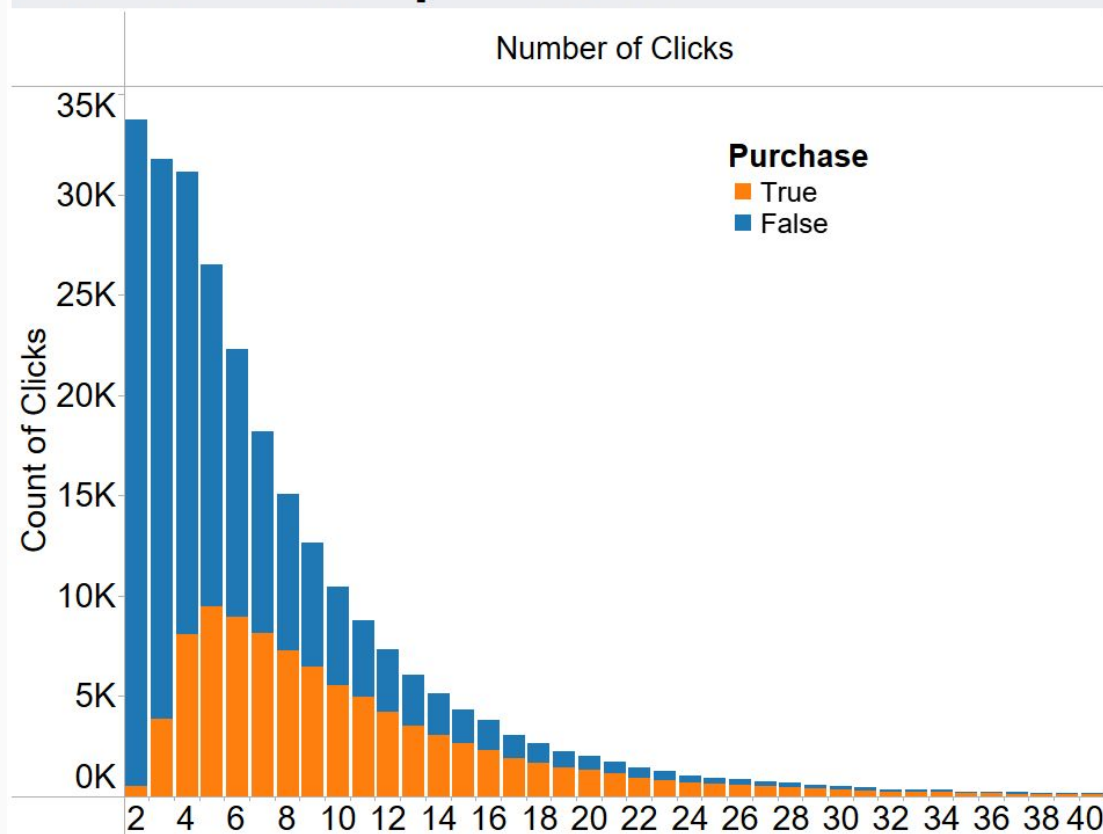

# Notable Variables

# Clicks

## Purchase Rate per Clicks

# Proportion of Purchases per Clicks

## Purchase Rate per Clicks

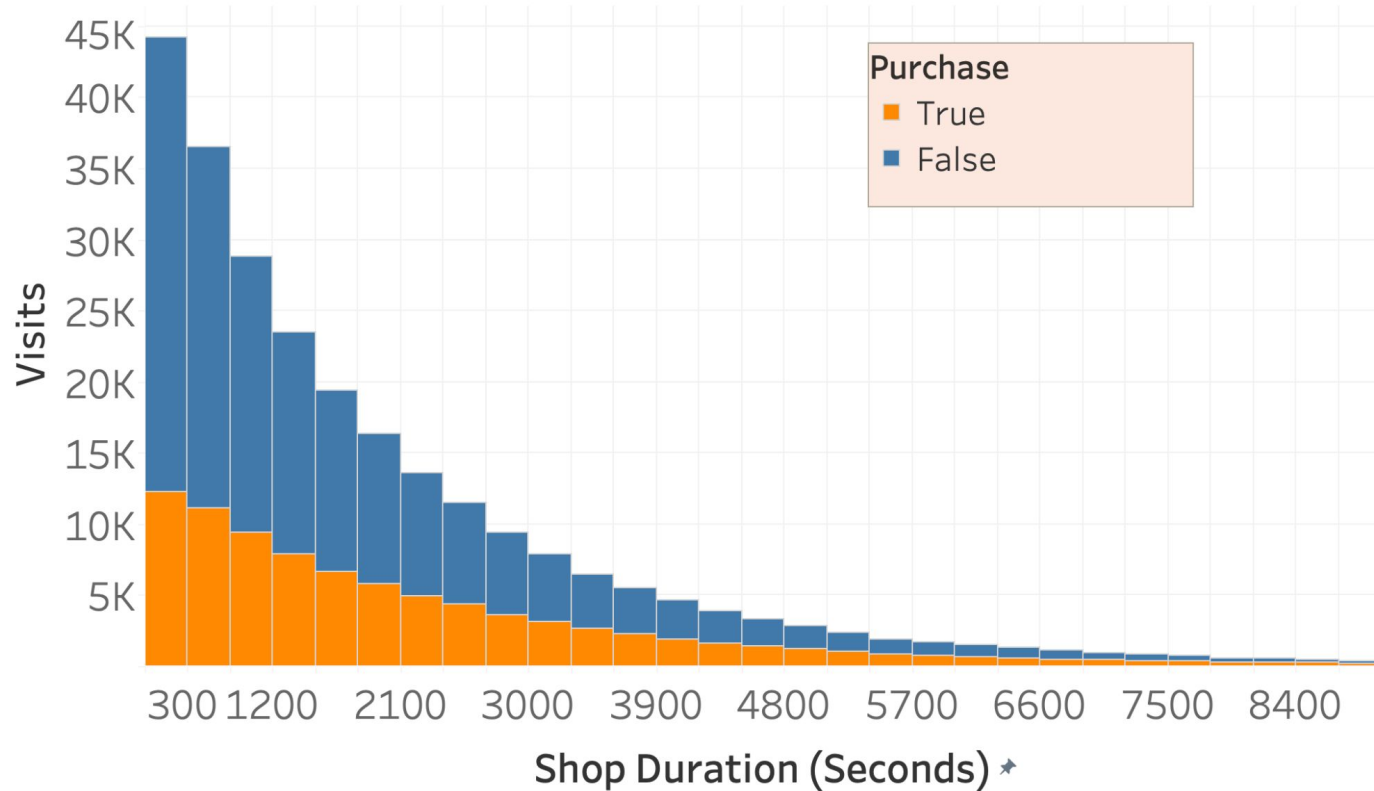

# Purchase Rate by Cart View

## Purchase Rate per Number of Cart Views

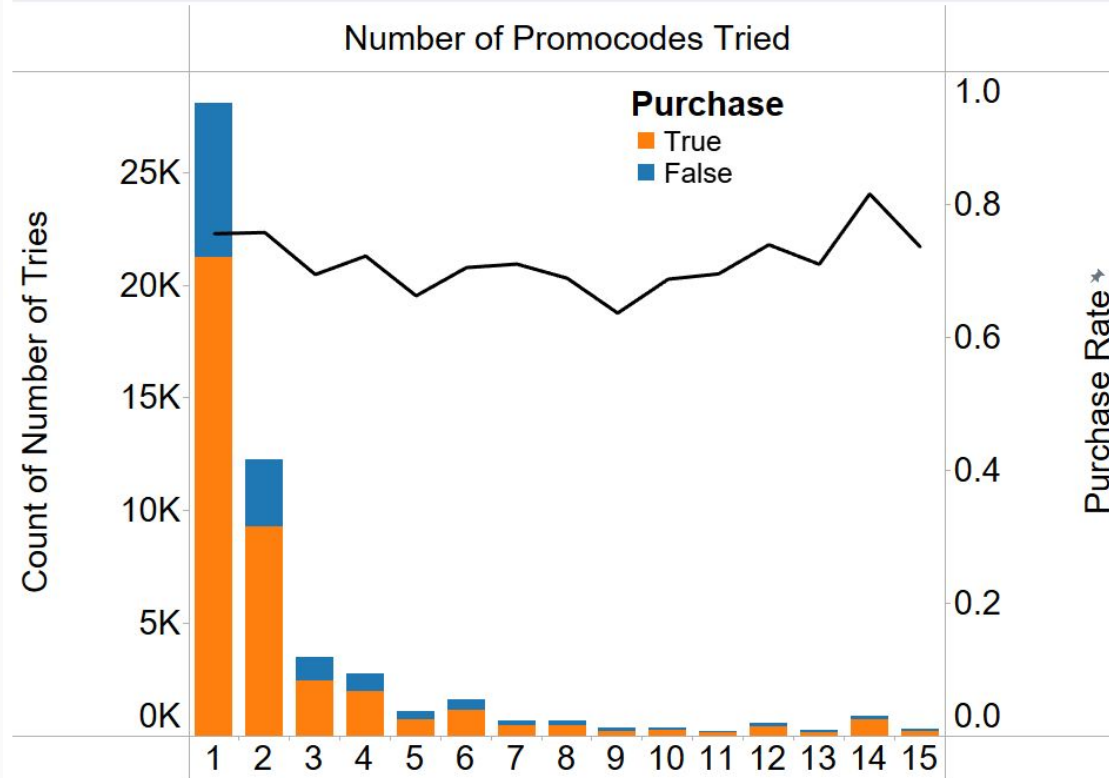

# Shopping Duration

## Purchase Rate Per Shop Duration

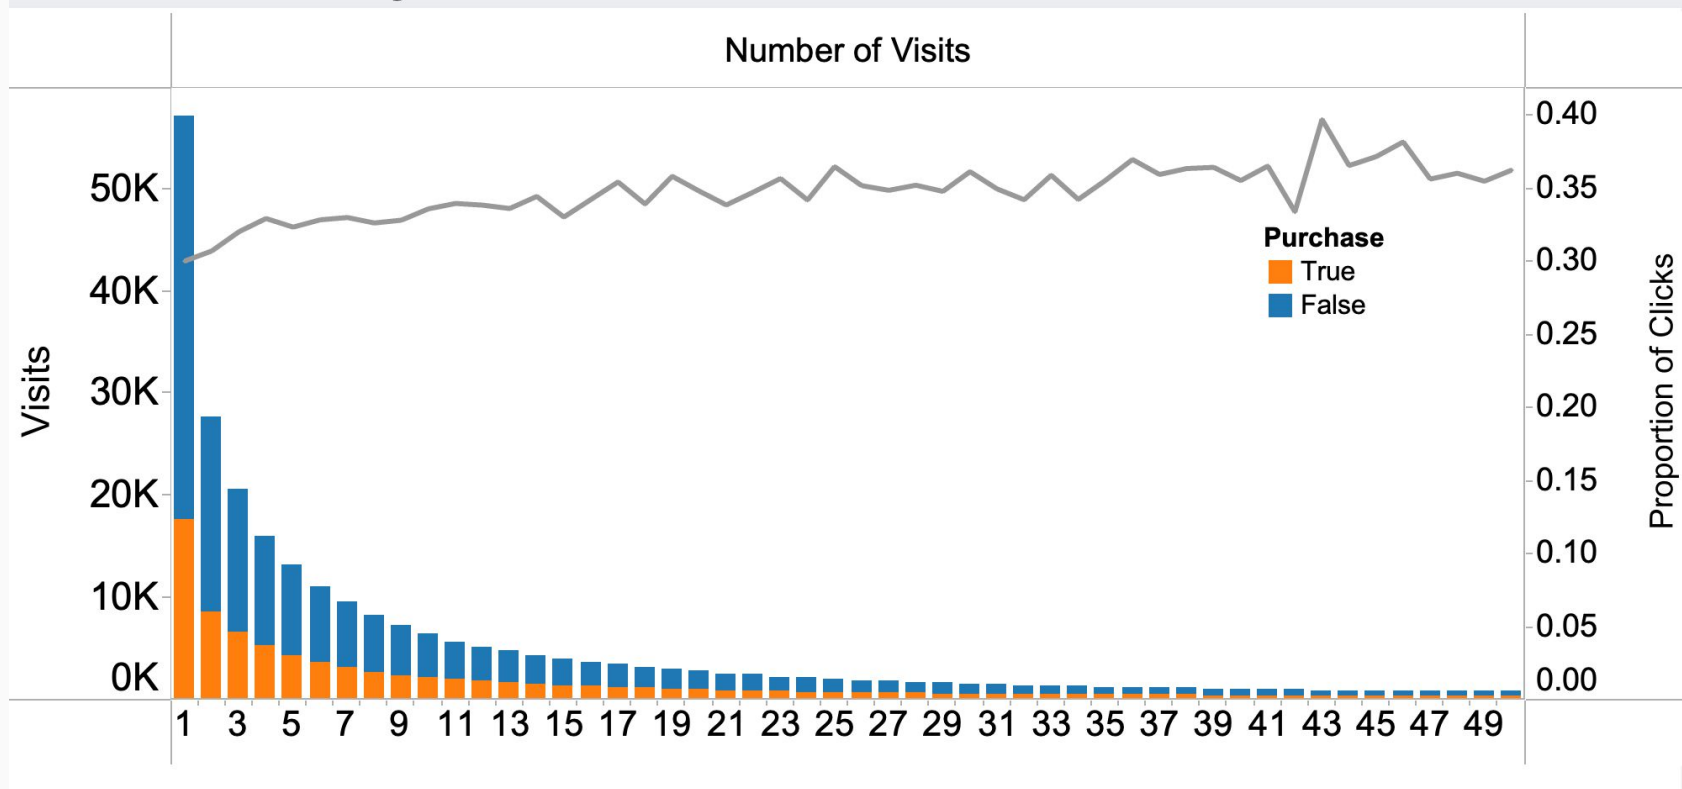

# Number of Promo Codes Tried

## Purchase Rate per Number of Promo Codes Tried

# Purchase Rate by Visit Number

## Purchase Rate by Visit Number

# Conclusion

What behavior will increase a visitor's chances of purchasing?

- Having **more clicks** on the website
- **Longer** shop durations
- Finding a **working promo code**

# Limitations/Future Plans

## **Imbalanced Data Set**

- Number of users abandoning cart outweighs purchasers  
→ Potential use of undersampling to improve models

## **Potential Confounding Variables**

- Shop duration and clicks naturally increase because it takes time and clicks to make a purchase on Fingerhut.com.
  - In our paper we must investigate statistical significance of the increasing trends we identified in our models and plots

# Future Work

## **Implementation of Undersampling**

→ Address imbalanced data set limitation

## **Potential inclusion of price and review data**

→ Expand variable pool to increase model accuracy

## **Deeper dive into impact of confounding variables**

→ Address confounding variable limitation
